</tbody>
</table>
| 1. Gross profit margin                     | \[
\frac{Sales - Cost of goods sold}{Sales}
\]                                                                                  | An indication of the total margin available to cover operating expenses and yield a profit.                                                                                                                     |
| 2. Operating profit margin (or return on sales) | \[
\frac{Profits before taxes and before interest}{Sales}
\]                                                                                           | An indication of the firm's profitability from current operations without regard to the interest charges accruing from the capital structure.                                                               |
| 3. Net profit margin (or net return on sales) | \[
\frac{Profits after taxes}{Sales}
\]                                                                                                 | Shows after tax profits per dollar of sales. Subpar profit margins indicate that the firm's sales prices are relatively low or that costs are relatively high, or both. |
| 4. Return on total assets                  | \[
\frac{Profit after taxes}{Total assets} \quad \text{or} \quad \frac{Profits after taxes + interest}{Total assets}
\] | A measure of the return on total investment in the enterprise. It is sometimes desirable to add interest to aftertax profits to form the numerator of the ratio since total assets are financed by creditors as well as by stockholders; hence, it is accurate to measure the productivity of assets by the returns provided to both classes of investors. |
| 5. Return on stockholder's equity (or return on net worth) | \[
\frac{Profits after taxes}{Total stockholders' equity}
\]                                                                                         | A measure of the rate of return on stockholders' investment in the enterprise.                                                                                                                                  |
| 6. Return on common equity                 | \[
\frac{Profits after taxes - Preferred stock dividends}{Total stockholders' equity - Par value of preferred stock}
\] | A measure of the rate of return on the investment which the owners of the common stock have made in the enterprise.                                                                                             |
| 7. Earnings per share                      | \[
\frac{Profits after taxes - Preferred stock dividends}{Number of shares of common stock outstanding}
\] | Shows the earnings available to the owners of each share of common stock.                                                                                                                                       |
| **Liquidity Ratios**                       |                                                                              |                                                                                                                                                                                                             |
| 1. Current ratio                           | \[
\frac{Current assets}{Current liabilities}
\]                                                                                             | Indicates the extent to which the claims of short-term creditors are covered by assets that are expected to be converted to cash in a period roughly corresponding to the maturity of the liabilities. |
| 2. Quick ratio (or acid-test ratio)        | \[
\frac{Current assets - Inventory}{Current liabilities}
\]                                                                                       | A measure of the firm's ability to pay off short-term obligations without relying on the sale of its inventories.                                                                                                |
| 3. Inventory to net working capital        | \[
\frac{Current assets - Current liabilities}{Inventory}
\]                                                                                       | A measure of the extent to which the firm's working capital is tied up in inventory.                                                                                                                          |
| **Leverage Ratios**                        |                                                                              |                                                                                                                                                                                                             |
| 1. Debt-to-assets ratio                     | \[
\frac{Total debt}{Total assets}
\]                                                                                                           | Measures the extent to which borrowed funds have been used to finance the firm's operations. Provides another measure of the funds provided by creditors versus the funds provided by owners. |
| 2. Debt-to-equity ratio                     | \[
\frac{Total debt}{Total stockholders' equity}
\]                                                                                             |                                                                                                                                                                                                             |

</table>
**OPERATING CAPITAL**

1. **TOTAL TRADING CYCLE** - ESTIMATED NUMBER OF DAYS FROM DATE OF PURCHASE OF MATERIALS TO BE SOLD TO THE DATE OF THE COLLECTION FOR SALES MADE.

\[ \text{TTC} = \text{CASH} + \text{RECEIVABLES} + \text{INVENTORY} - \text{AVERAGE SALES PER DAY} \]

2. **NET CASH CYCLE** - NUMBER OF DAYS THAT CASH IS TIED UP IN CONDUCTING BUSINESS

\[ \text{NCC} = \text{TTC} - \text{PAYABLES/ASPD} \]

**DEGREE OF OPERATING CASH LEVERAGE**

THE DOLLAR AMOUNT OF ADDITIONAL SALES REQUIRED TO PUT A DOLLAR OF CASH "IN THE BANK."

\[ \text{DOCL} = \frac{S}{(S-V-(CE+A/R+[1-A/P]))(1-T)} \]

WHERE:

- **S** = TOTAL SALES
- **V** = VARIABLE COSTS
- **CE** = CASH & EQUIVALENTS
- **A/R** = ACCOUNTS RECEIVABLE
- **I** = INVENTORY
- **A/P** = ACCOUNTS PAYABLE
- **T** = INCOME TAX RATE

**STRATEGIC PROFIT MODEL (AKA THE DU PONT CHART)**

RATE OF RETURN ON NET WORTH =

\[ \text{NET PROFIT MARGIN} = \frac{\text{NET PROFIT BEFORE TAX}}{\text{NET SALES}} \times \text{RATE OF ASSET TURNOVER} = \frac{\text{NET SALES}}{\text{TOTAL ASSETS}} \times \text{LEVERAGE RATIO} = \frac{\text{TOTAL ASSETS}}{\text{NET WORTH}} \]

\[ \text{RORNW} = \text{NPM} \times \text{RATIO X LR} = \frac{\text{NPM}}{\text{NET WORTH}} \]

**INDEX OF SUSTAINABLE GROWTH (G*)**

IF THE PLANNED GROWTH RATE OF SALES EXCEEDS G*, THEN EXTERNAL CAPITAL MUST BE SOUGHT TO FUND THE DESIRED GROWTH RATE.

\[ G^* = \left[ \frac{P(1-D)(1+L)}{T-P(1-D)(1+L)} \right] \times 100 \]

WHERE:

- **P** = \( \frac{\text{NET PROFIT BEFORE TAX}}{\text{NET SALES}} \times 100 \)
- **D** = TARGET DIVIDENDS/\( \text{PROFIT AFTER TAX} \)
- **L** = \( \frac{\text{TOTAL LIABILITIES}}{\text{NET WORTH}} \)
- **T** = \( \frac{\text{TOTAL ASSETS}}{\text{NET SALES}} \times 100 \)
BANKRUPTCY PREDICTION
(aka Altman’s Z-Score)

\[ Z = 1.2X1 + 1.4X2 + 0.6X4 + 1.0X5 + 3.3X3 \]

WHERE:

\[ X1 = \frac{\text{CURRENT ASSETS} - \text{CURRENT LIABILITIES}}{\text{TOTAL ASSETS}} \]
\[ X2 = \frac{\text{RETAINTED EARNING}}{\text{TA}} \]
\[ X4 = \frac{\text{MARKET VALUE OF EQUITY}}{\text{TOTAL LIABILITY}} \]
\[ X5 = \frac{\text{NET SALES}}{\text{TA}} \]
\[ X3 = \frac{\text{EARNINGS BEFORE TAXES} + \text{INTEREST}}{\text{TA}} \]

STRATEGIC FUNDS PROGRAMMING

INTERNAL SOURCES =

\[ \text{PROFIT AFTER TAXES} - \text{DIVIDENDS} + \text{RETAINTED EARNING} + \text{DEPRECIATION} + \text{OTHER NON-CASH EXPENSES} = \text{CASH FLOW FROM OPERATIONS} \]

AUGMENTED DEBT =

\[ \text{RETAINTED EARNINGS} \times \text{CURRENT TOTAL DEBT-TO EQUITY RATIO} = \]

FUNDS FROM WITHIN CURRENT STRUCTURE

EXPANDED DEBT CAPACITY =

\[ \text{NEWLY NEGOTIATED LONG-TERM DEBT/EQUITY RATIO} - \text{CURRENT LONG-TERM DEBT/EQUITY RATIO} = \frac{\text{(UNUSED DEBT FACTOR)} \times \text{SHAREHOLDERS EQUITY}}{\text{EXPANDED DEBT CAPACITY}} \]

TOTAL FUNDS AVAILABLE (MAXIMUM) = \[ \text{CASH FLOW FROM OPERATIONS} + \text{FUNDS FROM WITHIN CURRENT STRUCTURE} + \text{EXPANDED DEBT CAPACITY} \]
